

• class Calculator

└ int add (int a, int b)  
└ return a+b;

2 parameters

└ int add (int a, int b, int c)  
└ return a+b+c;

3 parameters

①. Both have same name, but different parameters  
\* [method add() is overloaded]

└ double add (double a, double b)  
└ return a+b;

② - (Same name, different type)

• This is called method overloading.

psvm:-

└ sout (obj.add(2,3));

sout (obj.add(2,3,5,2));

sout (obj.add(1,2,3));
